Brendan Dutton

Future Vision
Remembering Humanity

"A future where artificial intelligence preserves human stories instead of replacing them."

My Statement:

We see a future where technology strengthens humanity instead of replacing it. Artificial intelligence should become a partner in preserving history, connecting generations, and making knowledge accessible to everyone. Designers have a responsibility to make sure that every innovation remains grounded in authentic human experience. By combining human experience with intelligent technology, we can create a future where no story is forgotten.

Present (2026)

Millions of personal stories remain hidden in diaries, photographs and family collections. Without thoughtful design, these memories risk disappearing as generations pass.

A Future Without Authenticity

Artificial intelligence produces an infinite amount of content without truth or context. Authentic stories become buried beneath fake information. History becomes difficult to trust, while design loses its human purpose and emotional connection.

A Future That Remembers

Artificial intelligence works alongside people to preserve memories, restore historical records, translate forgotten languages, and make personal stories accessible across the world. Design helps connect generations rather than replacing them.

How We Build This Future

Human stories come first

AI supports genuine experiences rather than creating artificial replacements.

Design with transparency

People should always know where information comes from and whether AI assisted in creating it.

Preserve before creating

Protect existing histories and cultures before generating new digital content.

Humans remain responsible

Designers verify, interpret and provide meaning while AI assists with repetitive tasks.

Technology should connect generations

Innovation should strengthen relationships between people, families and communities.

”

Technology should never replace humanity,
it should help humanity remember itself.

“
